

Flic™

Accessories

DOCKING STATION

Convenient, drop in dock to connect the scanner to a host

Mounting holes to secure the dock

UNIVERSAL HOLSTER

Broad opening guides the scanner securely in place

Cable slot for tethered mode

Belt Clip for portable applications

Double-sided tape for fixed applications

Mounting hole to attach to wall or cabinet

Scanner fits in holster with or without the boot

PROTECTIVE BOOT

Made of flexible, durable rubber

Easily slips over scanner

Improves ruggedness

Provides cable strain relief for tethered applications

Loop for attaching a lanyard or retractable badge reel

USB ADAPTERS

Used when a serial port is not available

Operates just like an extra serial port to the host

Microvision offers a variety of accessories to increase the flexibility of the Flic scanner. A docking station provides an ideal location for storing the scanner and uploading the data to a host computer. The dock can simply rest on a desktop or be permanently mounted using the built-in screw holes.

Another way to store the scanner is a universal holster made of tough, durable plastic. For portability, the holster comes with a belt clip to securely attach to a belt or pocket leaving the operator's hands free. For stationary applications the universal holster mounts to a monitor or wall. The holster is designed to work with or without the interface cable attached.

A protective boot, made of durable, flexible Sanoprene, easily slips over the scanner. It provides added protection while maintaining the original ergonomics. Additionally, the protective boot offers a strain relief loop for the interface cable when operating in tethered mode. The same feature can be used to attach a lanyard or retractable badge reel. The protective boot is compatible with the universal holster.

A USB adapter provides an optional connection when no serial port is available.
